```

```
The cloned gene is in its non-expressed state. The change in number of the coding repeat unit has caused the atg start codon in the signal peptide to be out of frame with the rest of its coding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         linear BCT 29-MAY-2002 section 144 of 469 of

AB			s capable of entering the bloodstream,			
	crossing the	blood-brain barri	Ler, and invading the meninges. The			
	other pathoge	enic Neisseria spe	ecies, Neisseria gonorrhoeae, generally			
causes an infection which is localized to the genitourinary tract.						
In order to investigate the genetic basis of this difference in						
disease profiles, we used a strategy of genomic comparison. We used						
DNA arrays to compare the genome of $N$ . meningitidis with those of $N$ . gonorrhoeae and Neisseria lactamica, a commensal of the nasopharynx.						
We thus identified sequences conserved among a representative set of						
virulent strains which are either specific to N. meningitidis or						
	shared with N	<ol> <li>gonorrhoeae but</li> </ol>	absent from N. lactamica. Though

these bacteria express dramatically different pathogenicities, these meningococcal sequences were limited and, in contrast to what has been found in other pathogenic bacterial species, they are not

organized in large chromosomal islands.

AB An important feature of disease caused by **Neisseria**meningitidis is the propensity to invade the meninges. Much progress
has been made in our understanding of how this **pathogen**circumvents the physical properties of this cellular barrier. This
review will address the new possibilities offered by the recent

The present invention relates to novel bacterial hemoglobin receptor proteins and genes that encode such proteins. The invention is directed toward the isolation, characterization, diagnostic and therapeutic use of bacterial hemoglobin receptor proteins, nucleic acids encoding such proteins, recombinant expression constructs comprising such nucleic acids and cells transformed therewith, and antibodies and epitopes of such hemoglobin receptor proteins. The invention relates particularly to hemoglobin receptor proteins and genes encoding such proteins from Neisseria species, especially N. meningitidis and serotypes thereof, and N. gonorrhoeae. Methods for the diagnostic and therapeutic use of the proteins, epitopes, antibodies and nucleic acids of the invention are also provided, including the use of proteins, epitopes, antibodies and nucleic acids of the invention for the production of vaccines effective in providing immunization of human against infection by pathogenic bacteria of Neisseria species.

AN 2001-082916 [10] WPIDS

AB

EP 1069133 A UPAB: 20010220

NOVELTY - Immunologically active polypeptides (I) derived from the Gram negative bacteria Neisseria meningitidis, and the nucleic acids (II) that encode them, are new.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are included for the following:

- (1) an isolated polypeptide (I) comprising an amino acid sequence that has at least 70% identity to 44 defined amino acid sequences ((A1)-(A44)) given in the specification;
  - (2) an immunogenic fragment of (I) which comprises (A1)-(A44);
- (3) an isolated polynucleotide (II) comprising a nucleotide sequence encoding (I) (which has at least 70% to (A1)-(A44) over its entire length), or a sequence complementary to (II);
- (4) an expression vector (III) or a recombinant live microorganism comprising (II);
- (5) a host cell (IV) comprising (III), or a membrane of (IV), that expresses a polypeptide comprising an amino acid sequence with at least 70% identity to (A1)-(A44);
- (6) a process (V) for producing a polypeptide comprising an amino acid sequence with at least 70% identity to (A1)-(A44), comprising culturing the host cell (IV) under suitable conditions for expression of the polypeptide and recovering the polypeptide from the culture medium;
- (7) a process (VI) for expressing the polynucleotide (II), comprising transforming a host cell with an expression vector comprising (II) and culturing the host cell under conditions suitable for expression of the polypeptide;
- (8) vaccine compositions (VII) comprising (I) and/or (II);
  - (9) antibody (VIII) immuno-specific for (I); and
- (10) a method for diagnosing a **Neisseria** infection, comprising identifying (I) or (VIII) in a sample from the subject animal.

ACTIVITY - Antibacterial.

MECHANISM OF ACTION - Vaccine.

Rabbit antiserum produced in response to **vaccination** with the polypeptides killed 65% of parenterally administered meningococcus (strain 8013) with in 20 minutes of contact and all of the bacteria within 60 minutes. Pre-immune serum (taken prior to **immunization**) was found to have killed no bacteria after 20 minutes and only half after 60 minutes.

USE - The nucleic acids and the polypeptides they encode may be used to vaccinate subjects against infection by Neisseria meningitidis bacteria according to standard methodologies. The antibodies produced in response to the polypeptides and/or polynucleotides may also be used to treat N. meningitidis infections or as diagnostic reagents in immunoassays to detect infections (claimed). N. meningitidis is a pathogen involved in, for example, bacteremia and meningitis. Dwg.0/50

LANGUAGE: SUMMARY LANGUAGE:

Neisseria meningitidis serogroup B infections are among the major causes of fulminant septicemia and meningitis, especially severe in young children, and no broad vaccine is available yet. Because of poor immunogenicity of the serogroup B capsule, many efforts are now devoted to the identification of protective protein antigens. Among those are PorA and, more recently, transferrin-binding protein B (TbpB). In this study, TbpB of N. meningitidis was genetically fused to the N-terminal domain of the Bordetella pertussis filamentous hemagglutinin (FHA), and the fha-tbpB hybrid gene was expressed in B. pertussis either as a plasmid-borne gene or as a single copy inserted into the chromosome. The hybrid protein was efficiently secreted by the recombinant strains, despite its large size, and was recognized by both anti-FHA and anti-TbpB antibodies. A single intranasal administration of recombinant virulent or pertussis-toxin-deficient, attenuated B. pertussis to mice resulted in the production of antigen-specific systemic immunoglobulin G (IgG), as well as local IgG and IgA. The anti-TbpB serum antibodies were of the IgG1, IgG2a, and IgG2b

recombinant B. pertussis may be a promising vector for the development of a mucosal vaccine against serogroup B meningococci.

AB Meningococcal disease remains an important public health burden worldwide and, indeed, cause of death, particularly in poorer countries. The rapidly progressive nature of infections means that antibiotic therapy often comes too late. Vaccines are of limited efficacy in infants, one of the most vulnerable age groups, and do not exist for bacteria of serogroup B. Hence, much remains to be achieved in terms of vaccine design and the understanding of the **pathogenesis** of meningococcal disease. The causative bacterium, Neisseria meningitidis, is usually a commensal of the nasopharynx. Factors that lead to the invasion of the bloodstream, often followed by the crossing of the blood-brain barrier and meningitis, may be partly host- and partly bacterium-dependent, but are ill-understood. It is hoped that, taken together with the fundamental knowledge gained from biochemical and genetic studies, the huge amount of new information made available with the recent publication of the genome sequences will help to unlock more of the secrets of the lifestyle and pathogenic potential of this still poorly understood pathogen.

AB The invention claims a DNA mol. encoding a Hb receptor protein from Neisseria meningitidis serotype B. The invention also claims the use of said DNA in construction of an expression construct and cells transformed with said expression construct for the recombinant prodn. of Hb receptor. The invention further provides a nucleic acid mol. fully complementary to N. meningitis serotype B Hb receptor DNA as a diagnostic agent. The DNA sequence, as well as the corresponding amino acid sequence of N. meningitis serotype B Hb receptor are provided. In the example section, the invention provided methods used clone Hb receptor genes (hmbR) from N. meningitis serotypes A and C, as well as from N. gonorrhoeae. The exampled also provided the DNA sequences, as as corresponding amino acid sequences, of these cloned Hb receptor. The invention further showed that: (1) the hmbR gene product is a Hb receptor in N. meningitis; (2) N. meningitis Hb receptor of the invention is TonB-dependent and (3) an IS1106 element is located downstream of hmbR gene in N. meningitis serotype C. Still further the invention discussed use of the proteins, epitopes, antibodies and nucleic acids of the invention for the prodn. of vaccines effective in providing immunization of a human against infection by pathogenic bacteria of Neisseria species.

The present invention relates to a novel bacterial hemoglobin receptor protein and genes that encode such a protein. The invention is directed toward the isolation, characterization, diagnostic and therapeutic use of a bacterial hemoglobin receptor protein, nucleic acid encoding such a protein, recombinant expression constructs comprising such nucleic acids and cells transformed therewith, and antibodies and epitopes of such hemoglobin receptor proteins. The invention relates particularly to hemoglobin receptor proteins and genes encoding such proteins from Neisseria species, especially N. meningitidis. Methods for the diagnostic and therapeutic use of the proteins, epitopes, antibodies and nucleic acids of the invention are also provided, including the use of the proteins, epitopes, antibodies and nucleic acids of the invention for the production of vaccines effectinve in providing immunization of a human against infection by

AB The distribution of the two isotypes of tbpB in a collection of 108 serogroup B meningococcal strains belonging to the four major clonal groups assocd. with epidemic and hyperendemic disease (the ET-37 complex, the ET-5 complex, lineage III, and cluster A4) was detd. Isotype I strains (with a 1.8-kb tbpB gene) was less represented than isotype II strains (19.4 vs. 80.6%). Isotype I was restricted to the ET-37 complex strains, while isotype II was found in all four clonal complexes. The extent of the allelic diversity of tbpB in these two groups was studied by PCR restriction anal. and sequencing of 10 new tbpB genes. Four major tbpB gene variants were characterized: B16B6 (representative of isotype I) and M982, BZ83,

and 8680 (representative of isotype II). The relevance of these variants was assessed at the antigenic level by the detn. of cross-bactericidal activity of purified IgG prepns. raised to the corresponding recombinant TbpB (rTbpB) protein against a panel of 27 strains (5 of isotype I and 22 of isotype II). The results indicated that rTbpB corresponding to each variant was able to induce cross-bactericidal antibodies. However, the no. of strains killed with an anti-rTbpB serum was slightly lower than that obtained with an anti-TbpA+B complex. None of the sera tested raised against an isotype I strain was able to kill an isotype II strain and vice versa. None of the specific antisera tested (anti-rTbpB or anti-TbpA+B complex) was able to kill all of the 22 isotype II strains tested. Moreover, using sera raised against the C-terminus domain of TbpB M982 (amino acids 352 to 691) or BZ83 (amino acids 329 to 669) fused to the maltose-binding protein, cross-bactericidal activity was detected against 12 and 7 isotype II strains, resp., of the 22 tested. These results suggest surface accessibility of the C-terminal end of TbpB. Altogether, these results show that although more than one rTbpB will be required in the compn. of a TbpB-based vaccine to achieve a fully cross-bactericidal activity, rTbpB and its C terminus were able by themselves to induce cross-bactericidal antibodies. 46

Neisseria meningitidis and Neisseria gonorrhoeae give rise to dramatically different diseases. Their interactions with the host, however, do share common characteristics: they are both human pathogens which do not survive in the environment and which colonize and invade mucosa at their port of entry. It is therefore likely that they have common properties that might not be found in nonpathogenic bacteria belonging to the same genetically related group, such as Neisseria lactamica. Their common properties may be detd. by chromosomal regions found only in the pathogenic Neisseria species. To address this issue, we used a previously described technique (C. R. Tinsley and X. Nassif, Proc. Natl. Acad. Sci. USA 93:11109-11114, 1996) to identify sequences of DNA specific for pathogenic neisseriae and not found in N. lactamica. Sequences present in N. lactamica were phys. subtracted from the N. meningitidis Z2491 sequence and also from the N. gonorrhoeae FA1090 sequence. The clones obtained from each subtraction were tested by Southern blotting for their reactivity with the three species, and only those which reacted with both N. meningitidis and N. gonorrhoeae (i.e., not specific to either one of the pathogens) were further investigated. In a first step, these clones were mapped onto the chromosomes of both N. meningitidis and N. gonorrhoeae. The majority of the clones were arranged in clusters extending up to 10 kb, suggesting the presence of chromosomal regions common to N. meningitidis and N. gonorrhoeae which distinguish these pathogens from the commensal N. lactamica. The sequences surrounding these clones were detd. from the N. meningitidis genome-sequencing project. Several clones corresponded to previously described factors required for colonization and survival at the port of entry, such as IgA protease and PilC. Others were homologous to virulence-assocd. proteins in other bacteria, demonstrating that the subtractive clones are capable of pinpointing chromosomal regions shared by N. meningitidis and N. gonorrhoeae which are involved in common aspects of the host interaction of both pathogens.

Libraries of genes for antibody light and heavy chains, including AΒ const. and variable regions, in bacteriophage or phagemid vectors

> Searcher : 308-4994 Shears

that are capable of undergoing in vivo recombination are described for use in the generation of new antibody types in bacterial hosts. One suitable mechanism is xis-mediated excision. Sep. vectors are used for light and heavy chain genes and the variable regions are manufd. as fusion proteins with a capsid protein to direct surface display. The vectors can undergo one or more irreversible recombinations to generate recombinant final vectors with possible new genes for variable regions. The method increases the efficiency of generation and detection of new antibody types.

AB The present invention relates to novel bacterial Hb receptor proteins and genes that encode such proteins. The invention is directed toward the isolation, characterization, diagnostic and therapeutic use of bacterial Hb receptor proteins, nucleic acids encoding such proteins, recombinant expression constructs comprising such nucleic acids and cells transformed therewith, and antibodies and epitopes of such Hb receptor proteins. The invention relates particularly to Hb receptor proteins and genes encoding such proteins from Neisseria species, esp. N. meningitidis and serotypes thereof, and N. gonorrhoeae. Methods for the diagnostic and therapeutic use of the proteins, epitopes, antibodies and nucleic acids of the invention are also provided, including the use of the proteins, epitopes, antibodies and nucleic acids of the invention for the prodn. of vaccines effective in providing immunization of a human against infection by pathogenic bacteria of Neisseria species.

AB This monograph on treatment and prevention strategies for bacterial meningitis is based on approximately 500 articles and represents the collective work of a group of experts assembled by the INSERM, the French National Institute of Health and Medical Research. The book provides a useful reference to health care professionals, medical instructors and researchers, public health professionals, epidemiologists and those involved with health care policy. The first of the book's two sections represents a detailed analysis of the current world literature on various aspects of bacterial meningitis that was developed during a series of meetings of the

expert group. The first part of this analytical section is devoted to general aspects of bacterial meningitis and contains chapters on clinical data and pathophysiology, germs and diagnostic methods, epidemiological and socioeconomic data. The following part discusses treatment and vaccinal prevention of bacterial meningitis, including antibiotic treatment and prophylaxis, current vaccines and vaccine strategies for dealing with four of the bacterial meningitis pathogens (Haemophilus influenzae- b, Neisseria meningitidis, Streptococcus pneumoniae and Mycobacterium tuberculosis). The third part of the analytical section focuses on prospects for vaccines against meningitis, especially vaccines against the Neisseria meningitidis, Streptococcus pneumoniae and Mycobacterium tuberculosis pathogens. The second section of the book provides a synthesis of the information available on bacterial meningitis, its treatment and the research and development of vaccines for its prevention. This section concludes with seven recommendations developed by the group of experts for the therapeutic management and prevention of bacterial meningitis. Tables, graphs, diagrams and end-of-chapter bibliographies supplement the text.

The ability to interact with nonphagocytic cells is a crucial virulence attribute of the meningococcus and the genococcus. Like most bacterial pathogens, Neisseria meningitidis and Neisseria gonorrhoeae initiate infections by colonizing the mucosal epithelium, which serves as the site of entry. After this step, both bacteria cross the intact mucosal barrier. While N. gonorrhoeae is likely to remain in the subepithelial matrix, where it initiates an intense inflammatory reaction, N. meningitidis enters the bloodstream, and eventually the cerebrospinal fluid to cause meningitis. Both pathogens have evolved very similar mechanisms for interacting with host cells. Surface structures that influence bacterium-host interactions include pili, the meningococcal class 5 outer membrane proteins or the gonococcal opacity proteins, lipooligosaccharide, and the

meningococcal capsule. This review examines what is known about the roles these structures play in bacterial adhesion and invasion, with special emphasis, on pilus-mediated adhesion. Finally, the importance of these structures in neisserial pathogenesis is discussed.

The neisserial Lip antigen is a conserved antigen assocd. with the pathogenic Neisseria species, and is composed of multiple repeats of a consensus pentapeptide. A series of monoclonal antibodies reacting with meningococcal Lip antigen were subjected to epitope mapping, using solid-phase synthetic peptides based on the concensus repeat sequence. The antibodies were found to recognize different continuous epitopes based on the consensus sequence. One monoclonal antibody was utilized in affinity chromatog. to obtain purified Lip antigen and the antigen was used for immunization of mice. The resulting antisera

did not recognize Lip antigen on Western blots but reacted specifically with Lip antigen in immune pptn. expt., indicating that the predominant polyclonal immune response was directed against conformational epitopes. Despite the diversity of both continuous and conformational epitopes recognized by the antibodies produced, none of the antibodies demonstrated the ability to promote complement-mediated bactericidal activity. Thus, despite its initial apparent promise as a potential vaccine candidate the case for the inclusion of Lip antigen in vaccine formulation cannot be supported at present.
